Whether using one of our sites or many, we strive to provide you with a smooth and efficient experience, during the leasing process and beyond, using these 10 steps.

William Garrett, Vice President of Engineering, U.S. Tower Division, answers commonly asked questions regarding Revision H, the most recent update to the TIA's Tower Standard.

Service distributions caused by power outages can cost you time, money, and potentially customers. Learn how to keep wireless service operational when the grid fails.

At ATC Burkina Faso, we take customer service seriously. Our customers are encouraged to share their feedback, and we take action, with the goal of continually making it easier to work with us. We are committed to providing ongoing support to every customer, every step of the way.

Identifying potentially suitable areas for solar and wind project development can assist countries in reducing assessment costs. This allows the government to conduct more detailed evaluations that account for investment and operating costs of prospective plants in areas that are deemed most suitable.

This report provides insights on the country's potential to adopt solar PV and wind power; information on potential areas to explore in national grid infrastructure planning; and input for high-level policy models to ensure universal electricity supply and support for the long-term abatement of climate change. The study combines high-quality resource data with supplementary factors (i.e. protected areas, topography, transmission lines and road network proximity) using a suitability assessment approach.

The findings of this study indicate that a significant portion of Burkina Faso's land area is suitable for solar PV and wind development. It suggests a maximum development potential of approximately 95.9 and 1.96 gigawatts (GW) for solar PV and wind projects, respectively. These findings intend to prompt further action to identify specific sites for in-depth assessment using high resolution spatial and temporal data.
