

## Battery life thailand

Thailand is positioning itself as Southeast Asia's electric vehicle hub. It aims to have 650,000 electric two-wheelers on the roads by 2030 while becoming a centre of electric vehicle manufacturing. The country is also targeting 12,000 charging points and 1,450 battery swapping stations within the decade, reports the International Council on ...

The National Economic and Social Development Council (NESDC) has called for urgent action in Thailand to manage the impending surge in electric-vehicle (EV) battery waste, particularly lithium batteries, which is projected to reach 7.8 million tons annually by 2040. While EVs are touted as an eco-friendly solution, their batteries pose a significant environmental challenge if not handled ...

I didn't realize so many folks had experienced short battery life here in Thailand. A good Die Hard battery in my hometown would provide about four years of service and most of them are maintenance free. A good battery in the States would cost around \$75 (3,500 baht) or more.

The new model, named battery-as-a-service, is said to be the first in Southeast Asia, and will enable EV users to rent the car battery instead of owning it. TES, announced that it is working with partners to develop energy storage systems that will use retired EV batteries to store electricity for various commercial and residential energy needs.

The Analysis of EV Battery End-of-Life is a comprehensive study on the Life Cycle Assessment (LCA) of electric vehicles (EVs) in ASEAN countries, specifically focusing on Indonesia, Malaysia, Thailand, and Vietnam. It compares the environmental impacts of different vehicle types, including internal combustion engine vehicles (ICE), hybrid ...

Ruangchan, 53, pulls over and with a few presses on her phone, a door pops open. Inside is a freshly charged battery. Ruangchan swaps it in for the nearly depleted power cell in her bike and in two minutes speeds off in search of her next fare.

The battery swap station, which sprung in part from a project supported by the United Nations Environment Programme (UNEP), addresses a major drawback of electric vehicles: the relatively long time it takes to charge a battery from scratch.

In Southeast Asia, a region where two- and three-wheeled vehicles reign supreme, battery swapping stations are viewed as crucial to speeding the transition to electric transport. That shift, say experts, is vital for reducing greenhouse gas emissions and the air pollution that kills hundreds of thousands people annually.

"Electrifying two- and three-wheelers is an important piece of the puzzle if we're going to truly transform

urban transport," says Rob De Jong, head of UNEP's Sustainable Mobility Unit.

There were 230 million two- and three-wheeled vehicles on the streets of Southeast Asia as of 2020, found a report released earlier this year by UNEP. Three countries in the region, Indonesia, Thailand and Vietnam, rank in the top five globally in two-and three-wheeler ownership.

Most of these vehicles are powered by gasoline. But in Thailand, where 80 per cent of households have a two- or three-wheeler, a shift is underway. Here, policy changes, tax incentives and investments in higher education have fostered a wave of technological innovation that is giving electric vehicles a toehold in the market.

One of those efforts is a pilot project launched by UNEP and SolutionsPlus, a European Union-funded programme that supports the roll out of electric vehicles around the world.
