

Byd energy storage 180 kWh

Byd energy storage 180 kWh

o Environmentally friendly: No heavy metals or toxic chemicals.
o Long life: After 10,000 cycles, the battery retains 70% of its original capacity, which enables us to provide a 12-year warranty--the longest in the industry.
o Safe: Tested in the most extreme conditions
o Excellent performance in extreme temperatures
o Reliable operation from - 40° F to 140° F.

BYD Batteries have a 10-year track record and millions of on-road miles. That means BYD batteries are built to last up to 30 years of life, 20 to 25 years of warranty on eligible storage projects.

BYD Energy Storage System (ESS) technology offers a modular, flexible design and can be easily customized to meet diverse customer needs. Up to now, BYD has a lot of successful cases of ESS solutions from kW sized to GW sized systems at home and abroad.

BYD provides a full set of new energy solutions for the generation, storage and utilization of electricity. BYD's extensive new energy product lineup includes solar power stations, energy storage stations, electric forklifts, and LEDs.

Its creation of a zero-emissions Energy Ecosystem - comprising affordable solar power generation, reliable energy storage and cutting-edge electrified transportation--has made BYD an industry leader in the energy and transportation sectors.

Chinese battery manufacturer BYD will this week introduce an expanded portfolio of energy storage systems designed for the commercial and industrial solar markets. At The smarter E, the company will also offer a sneak peak at a new high-voltage storage system expected to be launched later this year.

BYD will present new additions to its Battery-Box product series in Munich, Germany, this week. Primarily, this means a new offering for the commercial & industrial solar market, which it is calling the Battery-Max Lite.

The new C&I battery system comes in capacities from 30 kWh to 90 kWh, and up to 64 units can be connected in parallel for a total capacity of 5.76 MWh. According to BYD, the new C&I battery is compatible with PV inverters from different manufacturers, allowing end users to mix and match to build the most efficient system. It also features open communication and control interfaces, so that the battery management system can be integrated into different energy management systems.

"We have designed the Battery-Box series with the goal to provide customers and installers with a maximum of versatility to fulfill a wide variety of application requirements with a flexible, modular system," said Julia Chen, Global Director, BYD Battery-Box. "For this reason, we also decided to follow an open system

Byd energy storage 180 kWh

approach making it possible to combine our Battery-Box systems with the most suitable components from trusted partners to achieve the best possible performance for each individual application scenario".

On the residential side, a recent study from the University of Applied Sciences in Berlin, Germany, found that BYD's products in combination with PV inverter suppliers amounted to the four most efficient systems on the market in Germany.

At The smarter E, BYD will also preview a new high-voltage storage product that it plans to launch later this year. Both products are based on lithium-iron phosphate battery chemistry, manufactured using BYD's "blade" battery technology. Visitors to the company's booth will be able to take a closer at these individual components.

"An energy storage battery system consists of battery cells, mechanical finishing and intelligent control systems. Considering this, the system performance is influenced by the entire value chain," said Chen. "To create the storage chemistry formula, to design the right cell format, to initiate the most accurate algorithm logic, to predict the life-cycle data, to realize the seamless communication with the inverters - these are important areas into which BYD is continually investing to keep driving the evolution of innovative energy storage solutions."
