Cote d ivoire energy storage investment

The blocks are located at depths ranging from 1,000 to 3,500m and are situated near Block CI-205, which contains the Calao discovery. According to Eni, their location presents opportunities to optimise operations through potential synergies in exploration and development.

In C?te d'Ivoire, the Italian oil and gas firm company currently operates six offshore blocks, CI-101, CI-205, CI-401, CI-501, CI-801, and CI-802. These operations are conducted in partnership with Petroci.

The Baleine field, which began production in August 2023 under Phase 1, is expected to move to Phase 2 in December 2024. This phase is projected to increase production to 60,000 barrels of oil per day (bpd) and 70 million cubic feet (MMcf), or approximately two million cubic metres, of associated gas.

All gas produced from the Baleine field during the initial and subsequent development phases will be transported onshore through a newly constructed pipeline. This infrastructure is designed to support C?te d'Ivoire's domestic electricity market by meeting local energy demands while improving access to power.
