There's nothing better than going for a swim in a nice, heated swimming pool on a breezy day, but electric pool heaters use quite a bit of electricity. A alternative energy of sunlight to sustainably warm up your swimming pool. While solar pool heaters are relatively cheap, building your own is even cheaper, and more fun. If you're the type who likes to build, you can design your very own. The materials are cheap and readily available, and it can be done in a day if you have some help. Keep reading to learn how to build your own DIY solar pool heater!

The better question is, why not? Solar water heaters tend to be inexpensive, even more so if you build your own. You can find the materials at a local hardware store for less than half the price of a high-quality solar pool heater. This guy made one for just \$25 bucks.

It doesn't take much time either. Two to three people can build one in a matter of hours. Even if you make some blunders, which you will, you'll have yours set up and running within a day. While it can be done alone, it's recommended to have at least one other person there to lend a hand.

While it's nice to order a premade solar pool heater from the internet, building your own gives you the freedom to create your own design. There's also no warranties to worry about, so you can modify it as much as you want. If it breaks or malfunctions, you don't have to put the blame on the manufacturer, since you made it yourself. You know how it was built, so you know exactly how to fix it.

Building a DIY solar heater is more simple than it seems. The materials are easily found at a hardware store. You're going to need wood to build a frame, an irrigation hose, a transparent hard plastic cover, and a pool pump. You should also keep a thermometer handy to check the temperature of the water.

The first step is to build a frame. This is going to be what houses the irrigation hose which collects the heat from the sun, similarly to how solar water heaters heat water for your home. You can build the frame in any shape you like, but to keep it simple, it's best to use a square or rectangular shape. Remember to build the frame according to the size of your pool. More water needs more volume and vice versa.

Use a large piece of plywood for the backing of the frame, then cut down some two-by-fours to enclose the borders of the backing. You can also use a two-by-four to bisect the backing and create two large areas to collect heat, like this guy did. This center beam will also double as a support beam.

Diy pool solar heating kits

It's very important to paint the frame black to help absorb heat from the sun, replicating the typically-black design of solar panels. You can paint the wood pieces separately before you build the frame, or you can paint the frame as a whole once it's put together.

If using a circular coiling pattern, you can run the hose in through the outside of the frame, and out through the center, or in one side and out the opposite end. If using a snake pattern, you'll be running the hose in through the top of the frame and out of the bottom from the opposite end. There may still be a significant amount of space in the center of the frame once the hose is coiled. This is a good place to drill in an extra support beam using a two-by-four, like this guy did his. This will come in handy when applying the cover later on.

Before moving on through to the next step, run some water through the hose and make sure it flows correctly. Check for holes and kinks, and do a temperature check of the water before and after it runs through the hose to check that it works correctly.

Now that you have the base of your heater complete, it's time to put the finishing touch. Enclosing the frame in a transparent sheet will protect the hose from the elements as well as create a greenhouse effect to help trap the sun's heat. Depending on the type of cover, the temperature inside the solar heater can reach well into the hundreds, more than enough to heat up your swimming pool.
