

Electric vehicle charging station details

Electric vehicle charging station details

The Joint Office of Energy and Transportation provides resources to help transportation stakeholders deploy electric vehicle (EV) charging infrastructure. The Alternative Fueling Station Locator from the U.S. Department of Energy's Alternative Fuels Data Center shows electric vehicle charging stations in the United States by charging level, access type, station status, and other key data points.

By default, this map displays available and temporarily unavailable direct current (DC) fast and Level 2 chargers for all charging networks and all connector types. To adjust the filters for this map, start by using the "Edit Filters" button.

After clicking on "Find Routes" you will be asked to choose which route you prefer from the proposed routes as seen below, on the right panel of the Trip Planner:

If you are planning to use the ChargeHub App to activate the station and pay, please make sure to select charging stations that have a golden thunderbolt in the center, as seen in the image below.

Unlike a gasoline-fueled car, one major perk of an electric vehicle is that you can plug it in at home or use an EV charging station when you're on the go.

Plugging into an electrical outlet at home is one thing. But those EV charging stations popping up at the end of big suburban parking lots or in urban parking garages open up a world of questions.

Good news! We have answers and a reminder not to be afraid of what is admittedly a very different infrastructure for electric cars than what you are used to with gas cars.

First things first: Download a charging station location app to your smartphone. Every EV's built-in navigation system can point you toward charging stations. But that is only half the battle. You will want the latest information, and many apps can tell you if the plugs are in use and if there is some fault with the station. This can save you tons of frustration.

Individual charging networks have their own apps. However, a widely used app is PlugShare, which relies on users to supply current information (pun intended) about charging stations. You'll find out about any recent changes and developments. For instance, is the EV charger in a parking lot now under construction, or are those chargers temporarily off-limits or charging slower than usual?

A good backup to download and utilize is ChargePoint. Sometimes it is easy to compare the two, and many users report that ChargePoint is more user-friendly than other apps.
