

Electric vehicle market kinshasa =

The Africa Electric Vehicle Market size is estimated at USD 15.80 billion in 2024, and is expected to reach USD 25.40 billion by 2029, growing at a CAGR of 10.20% during the forecast period (2024-2029).

Over the long term, factors such as increasing investment in the automotive industry, increased automobile production, and increased EV sales, coupled with rapid EV development and government policies for producing electric cars, may drive market growth.

Africa is one of the fastest-growing markets for electric vehicles. According to the Centre for Science and Environment, African countries have begun to set policies and aspirational targets for electrification. For example, Cape Verde has set 100% electrification targets for new sales of passenger cars by 2035 and urban buses by 2040.

Similarly, the United Nations Environment Programme (UNEP) expects electric and traditional two- and three-wheeler sales in Africa to increase substantially by 2050.

Considering the market potential, EV manufacturers and governments of various countries are focusing on new investments and policies to meet net zero emission goals in the future.

Various EV manufacturers are experiencing a surge in innovations and product launches to cater to the increasing demand for vehicle sales in 2024, and various e-mobility start-ups and businesses are emerging in many African countries to produce electric vehicles.

The focus on the transition toward new energy vehicles will also have a positive impact on the market as South Africa's cabinet has approved the Just Energy Transition Implementation Plan (JET IP). The JET IP is set for a five-year period (2023-2027), and the USD 1 billion guarantee program for Just Energy Transition (JET) has been approved by the African Development Bank Group. The program will support energy efficiency, rehabilitation of municipal electricity delivery, green hydrogen, and new electric vehicles.

An electric vehicle (EV) runs on electricity rather than an internal combustion engine (ICE). As a result, such a vehicle is viewed as a potential replacement for current-generation automobiles to address issues such as rising pollution, global warming, and depleting natural resources.

Passenger cars have gained immense popularity among drivers over the past few years due to features such as stylish design, compact size, and economic value. In numerous countries, passenger cars are the most common mode of transportation. The improving lifestyles, increasing purchasing power and disposable income, rising brand awareness, and growing economy are leading to changes in customer preferences worldwide, resulting in high sales of passenger cars.

With the increased demand, electric car sales have been growing exponentially due to falling costs, technological advancements, and government support, contributing to passenger car growth. In addition, a rise in the demand for SUVs creates profitable opportunities for market players and acts as a major driving factor for the passenger car market's growth worldwide.

South Africa holds the highest market share within Africa. Due to rising FDI and trade, the South African automotive industry's growth strategy has been centered on becoming strongly integrated into the global automotive environment.

Manufacturers like Mercedes, BMW, and Mitsubishi have announced their plans to launch new or next-generation model electric vehicles in South Africa. For instance,
