

Electricity rates denmark

With Russia invading Ukraine, it has had a profound effect on electricity prices in Denmark. The war in Ukraine, sanctions against Russian oil, and rising oil and gas prices have led to the price of electricity in Denmark increasing by as much as 15% in the second and third quarters of 2022.

According to the Danish power supply authority, compared to the third quarter of 2021, the increase in electricity has been nearly 83%. So, that brings us to the question - what are electricity prices in Denmark?

In October 2022, the wholesale electricity price in Denmark was 137.08 euros. Statistics reveal that this price is around 21% higher compared to the price that was prevalent in the same month a year earlier. This is adequate proof that electricity prices in Denmark and the rest of Europe are soaring, and there is no current way to stem this exponential price increase.

Winter is the time when wind power generation is low in Denmark. That is because wind speeds reduce, and this, in turn, affects power generation. Furthermore, natural gas and coal prices are also soaring. Many blame the Russian-Ukraine conflict for the increased natural gas and coal prices. So, this is also affecting electricity prices in Denmark.

So, if you are moving to Denmark for work, long-term stay, or higher education, you should know more about electricity prices in Denmark as that will affect your monthly budget and make the cost of living expenses. So, you should know a few things about electricity connection and prices in the country.

Homes in Denmark are automatically connected to the grid. So, when you move into your new home, it will already have electricity, and you will not have to worry about getting a connection.

Denmark follows EU regulations. Hence, people get electricity in their homes through the local grids. In Denmark, every grid is operated by a local electricity company; hence, there are several electricity grid companies in the country. Depending on where you reside, one of these companies will be responsible for connecting buildings and homes in that area to the local grid.

In the case of a new construction or a building that was previously not connected to the local grid, it can still get an electricity connection. To connect to the local grid, you would have to contact a qualified and licensed electrician. This electrician will then contact the local grid company on your behalf to install an electricity meter in your new home. After paying the necessary fee, the grid company will install the meter, and after that, your new home will get connected to the local electricity grid.

To be billed for electricity each month, you need an electricity meter that maintains a record of your electricity consumption. It is prudent to note that you do not own the meter. Rather, the ownership of the electricity meter

lies with the local grid company supplying you with electricity.

All homes and commercial buildings in Denmark have smart meters. That enables the local grid companies to read the meters and bill consumers remotely. It is important to note that while you connect to the local electricity grid, it is an electricity supply company that delivers electricity to your home. When you are billed for electricity consumption, your bill has two components:

Unlike an electricity supply company, a grid company is responsible for the proper operation and management of the grid. It also handles grid upgrades and reconstruction, grid expansion to cover more homes and buildings in the local area, ensuring energy savings, and measuring electricity consumption by end users.

You can check the Danish Energy website to find out which grid your home is connected to. You can enter your address in the search bar, which will give you the grid company that operates and distributes electricity in your area.
