

Flat plate solar system

A Flat plate collector is a solar panel device that uses solar energy to generate thermal energy. It converts solar power into thermal energy, i.e., cheaper energy utilising water as an operating fluid.

A Flat plate solar collector takes in solar radiation and transmits heat to the functioning medium. It is suitable for several thermal applications. The average temperature range of FPC devices is 100° C. Besides, these devices have an economical cost of investment.

The FPC devices are the backbone of solar thermal devices. They have diverse applications from household to commercial sectors. Flat plate collector devices are commonly used for active space heating and water heating for further usage.

The heat-absorbing plate of the collector is exposed to sunlight. As the sun rays hit the flat plate surface, a portion of their energy is transformed into heat. This leads to a rise in the temperature of the flat plate solar collector.

Eventually, the fluid transmits the thermal energy from collectors to the functioning energy systems for different uses. It works on the principles of the 1st & 2nd Laws of Thermodynamics.

On average, a one sq ft collector plate heats around ten litres (2 gallons) of water beyond 60°C every day. Hence, a single panel of 20 to 30 sq ft can heat about 300 litres (60 gallons) of water. This is approximately equal to the capacity of a standard hot water storage tank.

A flat plate collector without cover includes an absorber element made up of plastic, rubber, polypropylene, etc. Such solar plate collector devices are very reasonable.

Notably, the collector plates without cover having synthetic absorbers have efficient functioning. But, they may rapidly lose their efficiency when the atmospheric temperature is less than the working temperature, or strong winds are flowing.

The FPCs prove to be more feasible than other water heating systems due to their economical price, simple design, and easy installation. They greatly help to save on energy bills.

The primary drawback of a flat plate collector is the deprivation of optical concentration. Due to this, there is a larger area from which the heat energy is lost.

Picture this: using the sun's power not only for one home but to transform a nation towards sustainability. The rise of Flat Plate Solar Collectors (FPCs) is turning this dream into reality. They work with

Flat plate solar system

up to 60% efficiency, changing the game of energy economics. Solar thermal systems have become a primary choice. They are vital for renewable energy setups, not just a minor upgrade for homes.

In places like Erbil, the best tilt for these collectors is 30°. This angle captures the most sun all year long. Their smart design combines copper tubing and clear glazing. This mix converts sunlight to heat better than old generators. Flat plate collectors, efficient up to 77% under some conditions, are crucial for a cleaner future.
