## Green energy solutions business

The financialization of green energy represents an unqualified success. Both China and U.S. are world leaders in attracting capital to finance energy transformation. Chinese investments totaled \$546 billion in 2022 alone, while US investments trailed at \$141 billion. This inequality has become a major national security challenge for the U.S.

In only a decade, renewables went from an unthinkable costly and risky industry requiring significant government backing to power sources cheaper than some traditional fossil fuels. Given advances in intermittency mitigation and storage, renewables may become the principal source of electricity in 20-30 years.

Private sector investments spur technological innovation and lower energy costs while attracting the best and brightest. This green energy bonanza is a win for the consumer, wider economy, and environment.

While newcomers abound, only a few are capable of being truly transformative. These small companies are already producing technologies that could revolutionize renewable energy and induce fundamental transformations in international geopolitics and geoeconomics.

Common Energy's business model allows households to connect their electricity system to local renewable energy projects without individual onsite installation, instead opting to connect to wider power grids which buy power from local green energy. Once connected, the customer receives a statement showing the savings accumulated through clean energy credits and tax breaks customers can redeem during tax season.

Next Energy Technologies thinks they have windows into the future. They create energy-generating windows that convert unwanted infrared and ultraviolet light into electricity via ink-coated photovoltaic windows created through a mix of electrified materials applied during glass fabrication. These windows could help buildings achieve net-zero goals at a lower cost than other solar power technologies. While some large companies, such as Patagonia, have already embraced this technology for their physical locations, unresolved questions of maintenance and retrofitting linger.

These newcomers represent more than just an opportunity to buy stocks. Statistically speaking, most may not become the next Tesla TSLA . Instead, they represent a broad institutional acceptance from investors, a thriving business, and widespread enthusiasm for emerging technologies unique in modern investing. Most importantly, every entity here works on technologies that can transform our lives, making the planet cleaner, safer, and healthier.

Getting to net zero will require tremendous, rapid change and large-scale technology deployment across industries. The transition will create massive opportunities to build entirely new businesses.
