

Green linx battery review uk

Green linx battery review uk

Greenlinx are the UK's first battery to use High Power Density (HPD) Lithium Cells, which can utilise 100% of the battery capacity (other lithium batteries can only use 90%). This is a battery unit that can easily be retrofitted into an existing solar panel system, or be a part of the design from the initial planning. So it is a flexible system.

Greenlinx sells batteries with a capacity of 3.2 kWh per unit. It is easy to link multiple batteries together to obtain the amount of battery storage needed. For example, if the system requires 12.8 kWh of storage, then four batteries will have to be purchased.

Greenlinx is an established manufacturer of renewable technologies including battery storage products. The domestic and commercial battery solutions are distributed globally and have obtained a good market share as customers appreciate their quality. Greenlinx have developed a range of batteries to push the technological limits of performance, temperature management, ease-of-use, monitoring and technical support.

Greenlinx are exclusively distributed by Infinity Innovations Ltd. in the UK and Europe. While they are quite recent entrants to the UK market they are well-established in the battery storage industry worldwide.

The battery electricity storage system (BESS) is a useful add-on to any renewable energy generation system, particular solar panels. It can store energy for use when the sun is not shining. It can also take advantage of low grid pricing, for example, to acquire cheap electricity for use later. The BESS can also charge electric vehicles, which are becoming more prevalent on UK roads.

The Greenlinx battery system has two advantages in a power outage, compared to homes that only have grid-supplied electricity: it can feed emergency power to appliances and lights. The system also has a socket, so that an external appliance, for example a heater or a kettle can be plugged into it, even if the mains power is shut off.

The Greenlinx 3200 HPD battery offers power, quality, and robust performance with online monitoring to ensure that this is one of the premier products in the residential energy storage market.

This BESS unit is also easy to install: it can be floor-mounted or fixed to a wall. There does need to be airflow in the mounting location as batteries do get hot and need normal cooling. Unlike many other batteries, Greenlinx 3200 HPD is rated at IP 54 protection class, so it does have weather protection. However ESG Group recommends that all electrical equipment should be sited in a location away from the elements such as a carport, garage, under the eaves or a utility space. This will maximise the life-span of the battery.

Discharging: from -10~50°C Humidity ≤ 95% Protection class IP54 Cooling type Air cooled Communication

A: They are not mandatory. It depends on your budget. However they add flexibility to your home generation system, and could be a very important backup in the case of power outages.

A: No: some householders use batteries to maximise their savings on cheap electricity, by time-shifting off-peak energy and using it when needed, instead of higher-rate grid-supplied power.

A: Lithium-ion batteries are quite robust and maintenance-free. However they have a lifespan of 10-15 years, compared to 25 years for solar panels. This means that a battery system will need to be replaced at some point as it wears out. It is highly-likely that the cost of batteries will have come down substantially by then.
