

## Kuwait city clean electricity

Al-Hussein pointed out that global and local changes, such as climate change and Kuwait's 2019 commitment to reducing carbon emissions, necessitate a shift toward renewable energy. The authorities in Kuwait are actively preparing to launch and implement various energy projects in response. She highlighted the importance of the 2022 legislation on purchasing energy from citizens, which will bring a significant shift in renewable energy reliant on solar panels.

Suad Al-Hussein, head of the Kuwaiti Society for Sustainable Energy, mentioned that the organization was declared a public benefit association in 2022. Its mission is to educate society about the importance of sustainable energy and work alongside executive authorities to achieve the vision set by the late Amir Sheikh Sabah Al-Ahmad in 2012, aiming to produce 15% of Kuwait's 2019 electricity from sustainable energy. Since its establishment in 2018, the Association has conducted numerous activities and events, and it includes an elite group of specialists among its members.

Al-Hussein reiterated that within four years of installing solar panels, citizens will not pay for electricity consumption. She stressed the importance of motivating citizens to install solar panels through good loans and educating them on maintenance methods. She also highlighted the potential for significant energy savings and environmental benefits from these initiatives. Al-Hussein called for comprehensive support from both the state and private sectors to make these projects feasible, ensuring that Kuwait remains at the forefront of renewable energy adoption.
