Lifepo4 battery lithium

Lifepo4 battery lithium

LiFePO4 (or lithium iron phosphate) batteries are a subtype of rechargeable lithium-ion batteries that utilize unique chemistry to provide advantages over lithium technologies. The cathode of LFPs is made from...

As you know, the market has a wide range of batteries available for different purposes. Each product comes with a different energy storage capacity, lifespan, warranty, and price. Considering all these parameters, it is crucial to know which battery suits your requirements the best. For this, you must look at what type of appliances you want to power up with the battery.

Once you are familiar with the right battery type, you will be able to get the most out of it. This article specifically focuses on two battery types: lithium-ion and lithium iron phosphate. It presents a detailed discussion on LiFePO4 vs lithium ion batteries.

Read more to get familiar with which battery is right for you. In addition, this read presents a brief comparison between lithium and non-lithium batteries. Let's get into deeper specifics.

When we compare lithium iron phosphate vs lithium ion batteries, we can see that both are rechargeable and can be used multiple times by charging them every time they get discharged.

On the other hand, they are different from each other in terms of safety, lifespan, temperature range, chemical composition, energy density, weight, and voltage. Let's look at how each parameter makes them different from each other.

A lithium iron phosphate battery is safer than a lithium-ion battery. The reason behind this fact is that LiFePO4 batteries are less prone to exploding and overheating.

Though lithium ion batteries come with extended safety when installed and used properly, they are still prone to fire catching and overheating (when they are not installed correctly or are damaged).

The lifespan of LiFePO4 batteries is longer than a Li-ion battery. A lithium iron phosphate battery can last for over 10 years, even with daily use. On the other hand, the average lifespan of a lithium-ion battery is between 2 and 5 years. But, advanced Li-ion batteries can last for up to 10 years, but this is not the case with every unit.

Similarly, a LiFePO4 battery comes with more than 4,000 charge cycles, whereas a Li-ion battery supports between 2,000 and 3,000 charge cycles. Generally, the materials used during the battery's construction affect the lifespan. But remember, the usage pattern also has a direct impact on the life cycle of a battery.

Lifepo4 battery lithium

The temperature range at which LiFePO4 batteries can work perfectly is between -20 degrees Celsius and 60 degrees Celsius. In comparison, 0 degrees Celsius to 45 degrees Celsius is the optimal temperature range for lithium-ion batteries. This means that lithium iron phosphate batteries have a wider temperature range than lithium ion batteries.

LiFePO4 batteries can operate better in colder and hotter environments (without any performance degradation) than Li-ion batteries. Therefore, lithium iron phosphate batteries are the ideal choice for applications where stable battery performance is required in extreme temperatures, e.g., marine applications.
