The current research is funded by Universiti Malaysia Pahang Al-Sultan Abdullah (UMPSA) under grant number PGRS200322. The Center for Advanced Industrial Technology at UMPSA granted a postdoctoral research fellowship to Peddakapu Kurukuri.

Peddakapu Kurukuri: conceiving and designing the study, collecting data, composing the manuscript, analyzing and/or interpreting the data, revising the manuscript, and approving the final version for publication.

Mohd Rusllim Mohamed: conceiving and designing the study, analyzing and/or interpreting the data, critically revising the manuscript for significant intellectual content, and approving the version of the manuscript to be published.

Pavan Harika Raavi: analyzing and/or interpreting data, critically revising the manuscript for important intellectual content, and approving the version of the manuscript for publication.

In Malaysia, the microgrid market is gaining momentum as the country seeks to enhance its energy resilience, reduce carbon emissions, and improve energy access in remote areas. Microgrids provide a sustainable and reliable energy solution, integrating renewable sources, energy storage, and advanced control systems. Malaysia commitment to sustainable development and its efforts to diversify its energy mix have created opportunities for the growth of the microgrid market, especially in areas where grid connectivity is limited.

The Malaysia Microgrid Market is driven by the increasing adoption of renewable energy sources and the need for energy resilience. Microgrids offer a solution for integrating renewable energy resources, ensuring a stable power supply, and reducing energy costs, making them essential for both residential and industrial applications.

The microgrid market in Malaysia encounters challenges related to regulatory and policy frameworks. Developing a supportive regulatory environment for microgrid implementation and ensuring grid stability can be complex. Additionally, financing and investment hurdles are significant as building microgrids often requires substantial capital. Integration with the existing power infrastructure and ensuring the reliability of microgrids in the face of extreme weather events are also challenges for this market.

Microgrids are critical for ensuring reliable power supply in various sectors, including healthcare and telecommunications. The pandemic highlighted the importance of resilient energy infrastructure. The market has experienced increased interest and investment in building more robust microgrid systems to enhance energy security in critical facilities.
