

Microgrid control portugal

Microgrid control portugal

As part of our team, you'll dive into our renewable energy portfolio, taking the lead in executing cutting-edge Microgrid projects. Your day will be filled with opportunities to support the development of groundbreaking solutions and concepts that are shaping the future of sustainable energy. If you're ready to be at the forefront of change, this is the place to be!

Off the coast of Portugal, in the northern Azores, heavy dependence on fossil fuel imports, coupled with a growing climate crisis, puts the island of Graciosa in a very unique bind as it relates to energy security. Relying on oil, diesel and natural gas shipments has been a very expensive endeavor and traditionally the only option for isolated communities like Graciosa. Integrating renewable energy has not only become an economically viable alternative, it's also a sustainable one.

The Graciosa Hybrid Renewable Power Plant enables 1 MW of solar, 4.5 MW of wind power and a 6 MW / 3.2 MWh energy storage system to be supplied to the local grid, reducing the islands' reliance on petroleum imports and significantly reducing greenhouse gas emissions. Graciosa Lda's end client, local utility EDA, anticipates this investment will boost renewable energy consumption from 15% to 65%. Not only does this reduce the island's carbon footprint, but the hybrid island grid will also greatly impact the cost of energy going forward.

Graciosa is one of many islands pursuing a hybrid approach to island grid energy generation. This new hybrid renewable power plant is managed by GEMS, an energy management software system developed and installed by Wartsil. The result: an integrated power system combining renewables, engines, and energy storage that will deliver both economic and environmental benefits.

The GEMS platform uses artificial intelligence and data to control and balance multiple energy assets, automatically optimising energy generation based on load patterns and weather forecasts, increasing the use of renewable energy and decreasing the cost of diesel power generation, while improving the reliability of the island's energy grid.

Heavy dependence on external sources for energy fuel, including high costs of importing fossil fuels to power the island's energy grid and relative unreliability of supplies

Reduced island's reliance on imported fossil fuels and significantly cut down on greenhouse gas emissions by boosting renewable energy consumption from 15% to 65%

Electricidade dos Açores (EDA), the Portuguese energy provider on the Azores island of Terceira, has taken receipt of a new sustainable energy project that features microgrid control software and an energy storage system.

The Azores is an archipelago off the Atlantic coast of Portugal that's made up of nine volcanic islands. The region is popular with tourists thanks to its natural beauty and wildlife.

Each island in the archipelago has its own isolated autonomous energy system and is well-suited to take advantage of renewable energy resources including wind, solar, and geothermal.

EDA ultimately wants to have renewables account for up to 50% of its electricity mix, but for that to happen, fluctuations in renewable generation need to be addressed to ensure a reliable power supply for island residents and visitors.

The MGMS software forecasts energy consumption and production and uses real-time monitoring and optimization of all power generation assets to ease the challenges associated with integrating intermittent renewable energy sources such as wind and solar into the island's power grid.
