Mogadishu lg chem

(RTTNews) - Exxon Mobil Corp. (XOM), an oil and gas company, announced on Wednesday that it has inked a non-binding memorandum of understanding or MoU with LG Chem, a South Korean chemicals firm, for a multiyear offtake deal for up to 100,000 tons of lithium carbonate.

LG Chem's Tennessee cathode plant broke ground in 2023 and is expected to have an annual production capacity of 60,000 tons. This offers U.S. EV battery makers a domestically extracted and processed lithium supply option which is expected to have substantially lower environmental impacts, including approximately two-thirds less carbon intensity than hard rock mining.

Transparency is how we protect the integrity of our work and keepempowering investors to achieve their goals and dreams. And we haveunwavering standards for how we keep that integrity intact, from ourresearch and data to our policies on content and your personal data.

We sell different types of products and services to both investment professionalsand individual investors. These products and services are usually sold throughlicense agreements or subscriptions. Our investment management business generatesasset-based fees, which are calculated as a percentage of assets under management.We also sell both admissions and sponsorship packages for our investment conferencesand advertising on our websites and newsletters.

Maintaining independence and editorial freedom is essential to our mission ofempowering investor success. We provide a platform for our authors to report oninvestments fairly, accurately, and from the investor's point of view. We alsorespect individual opinions--they represent the unvarnished thinking of our peopleand exacting analysis of our research processes. Our authors can publish views thatwe may or may not agree with, but they show their work, distinguish facts fromopinions, and make sure their analysis is clear and in no way misleading or deceptive.

To further protect the integrity of our editorial content, we keep a strict separationbetween our sales teams and authors to remove any pressure or influence on our analysesand research.

Exxon Mobil Corp. and LG Chem signed a non-binding memorandum of understanding (MoU) for a multiyear offtake agreement for up to 100,000 metric tons of lithium carbonate.

The lithium would be supplied from ExxonMobil's planned project in Arkansas to LG Chem's cathode plant in Tennessee, which broke ground in December 2023. With an expected annual production capacity of 60,000 tons, the cathode plant is expected to be the largest of its kind in the US.

ExxonMobil's planned production of lithium will utilize direct lithium extraction (DLE) technology,

aligning with ExxonMobil's competencies in subsurface exploration, drilling, and chemical processing.

The approach, the company said, "offers US EV battery manufacturers a domestically extracted and processed lithium supply option which is expected to have substantially lower environmental impacts, including approximately two-thirds less carbon intensity than hard rock mining."

ExxonMobil has been working with local and state officials to enable a scale-up of the lithium industry in Arkansas and aims to become a leading supplier of lithium by 2030 (OGJ Online, Nov. 14, 2023). The operator holds about 120,000 gross acres in the Smackover formation and is targeting first lithium production in 2027.
