## Nicosia solar power

To access additional data, including an interactive map of global solar farms, a downloadable dataset, and summary data, please visit the Global Solar Power Tracker on the Global Energy Monitor website.

We want to offer consumers the best photovoltaics in Cyprus, so that they can fully benefit from their investment and at the same time develop a sustainable life using Renewable Energy Sources. We specialize in commercial, Net-Metering, Net-Billing, solar streetlights and solar water pump photovoltaics in Cyprus.

The same applies for Virtual Net-Metering for people who cannot install a photovoltaic system at their place of residence. In this case, the solar panels are installed at a different location but the system works the same way as standard Net-Metering.

Net-Billing in Cyprus is mostly used by large consumers and particularly for commercial purposes. The maximum power of a Net-Billing photovoltaic system in Cyprus is 8 MW. It is an extremely beneficial scheme which helps people make a profit by generating and using Renewable Energy Sources.

Commercial photovoltaic systems in Cyprus are usually used by businesses for self-consumption. That is, the energy generated by the solar panels is solely used for the building where the panels are installed. Unlike in a Net-Metering system, there is no calculation of the excess energy produced and reduction of the respective amount from the consumer's utility bill.

Solar pump maintenance is very important to ensure that the system works as it should and that the water is clean. Solar water pumps can be used for swimming pool cleaning, swimming pool water recycling, extracting water from wells as well as for agricultural purposes such as watering crops and livestock. Also, solar water pumps are used for remote areas where easy access to water is not an option.

On a sunny day in Cyprus, the water pump can be generated directly from the photovoltaic panels and at other times the energy produced by the panels can be stored in a battery to be used when needed, for example when there is not much sun.

Solar pumping is very beneficial both financially and environmentally. It is a low-maintenance watering option that does not require fuel and fuel spills. It can be easily installed, and it can operate without human monitoring.

Street lighting using solar panels in Cyprus is an excellent green way to save energy. Solar streetlights are ideal for residential streets, parking lots, parks, highways, industrial areas and other applications. They increase visibility on the street which makes roads safer for drivers and pedestrians.

## Nicosia solar power

Solar lighting uses LED lights which are very beneficial. Solar street LED lights are water-resistant, cost-effective, and low maintenance. Moreover, their light attracts much fewer insects than regular streetlights. Solar LED streetlights in Cyprus have a longer lifespan and easier installation than common lights, hence the lower cost.

The government of Cyprus, along with the RES and Energy Conservation Fund, offers support schemes for the installation of photovoltaic systems. This is because solar power is considered to be the future of energy and promoting the use of renewable energy sources is a priority. By giving the chance to more people who are concerned about the financial aspect to install a photovoltaic system, Cyprus can take advantage of the abundant sunshine it receives throughout the year while also meeting its national renewable energy obligations.

Our team offers maintenance services so that your photovoltaic panels in Cyprus always operate correctly. We monitor the numbers of our customers's solar panels in Cyprus regularly, and we visit them for inspection for errors that may affect the operation and productivity of the photovoltaic systems.
