The world's 7th largest economy and Europe's third-largest economy, France's renewable energy sources are taking steps towards a sustainable and green future.

The French Government has continuously supported the Energy Transition for Green Growth, and on par with it, the government has dedicated a huge chunk of public investments for energy and ecological transitions. The major objective of the government is for a significant reduction of fossil fuels with the closure of coal-based power plants while accelerating the change towards carbon-free well-balanced energy production.

The French economy is mainly dependent on the public sector and with this commitment of the French Government, many renewable energy companies in France are getting leverage to make the maximum use of green sources for energy.

The highest renewable energy source of electricity in France is hydropower with more than 25.7 GW of installed capacity. It is also the second-largest source of electricity generation in France behind nuclear power. Flexible and storable, it contributes actively to the balance of the electricity system and to network safety.

The capacity of wind and solar power has been improving drastically in the last few years with improvement in technology as well as the removal of several regulatory policies. Offshore wind projects have also been increasing in recent years and are aimed to help contribute to the transition of France towards renewable energy sources.

Amongst all French renewable energy companies in France, Voltalia stands at the topmost category as the group produces and sells electricity generated from wind, solar, hydraulic, biomass, and storage facilities that it owns and operates as renewable resources in France.

Since 2005, Voltalia acted as a service provider that fully supports its investor clients in renewable projects in all phases, from design to operation and maintenance, and has maintained its strata as a front runner that provides a global offer to private companies ranging from supply of green electricity and energy efficiency services to local production of their own electricity.

Being a part of an entitled industrial company, Voltalia has an operating and under construction capacity of more than 1.3 GW including a bunch of projects under development representing a total capacity of 8.5 GW.

Since hydrogen appears to be the most promising source of energy vector in order to move towards clean cars with high autonomy to accelerate competitive growth, decentralized solutions must be developed regarding hydrogen production, storage, and distribution.

Office energy storage paris

Founded in 2014, they took up an ambitious challenge to develop an innovative solution called electrolysis technology which was a major breakthrough in separation over the release of gaseous oxygen and hydrogen.

Overall, ERGOSUP is one of the prevailing French energy companies that cater to developing an innovative method for the storage and conversion of electricity into pressurized hydrogen. They supply decarbonated hydrogen for industrial applications, hydrogen service stations, and stationery massive energy storage solutions.

Among all renewable energy companies in France, EOLFI has evolved as a leading company that has reached an exceptional height in producing floating wind power and has been working on renewable energy projects both on and offshore and expanding renewable power business.
