

Portable mini hydroelectric generator

Portable mini hydroelectric generator

Whether you're looking to go green, save some money, or are just on the market for your next DIY project, hydroelectric generators might be an excellent choice.

Based on your location, you could be saving a ton on your electricity bill. Some hydroelectric generators have been in use for more than 500 years. While you definitely won't need that type of power, acquiring a micro-generator can help you live off-grid or provide your power needs during an outage.

If you would like to understand how this works on a larger scale, check out our article where we discuss the advantages and disadvantages of tidal energy. Most consumers think you need to live in a rural area next to a large river to generate electricity. In actuality, a small hydro turbine generator can be hooked up to pre-existing piping in your home and some can double as a wind turbine. While all are efficient, some are better in certain situations.

Rated at 1500W and capable of delivering 2000W, enough to power your average home. Full efficiency is generated at a water head height of 25 feet. It's an overall very powerful unit that will deliver results if you need its function.

The installation of this hydroelectric generator can be tricky for the average homeowner, but they offer great troubleshooting and advice. Getting it done right will result in some very worthwhile results. Surely this generator will require consistent water flow, so make sure you have enough water available before purchasing.

This water turbine generator is designed to use your average household piping. Keep in mind that this would only be used to supplement your existing energy. It's nearly the exact opposite of the Scott Hydro product, but it's still a great place to start and much more affordable. While you certainly will not be running your entire house on this generator, its low cost and ease of installation make it a viable option for anyone to go a little greener.

An easy install for showers or irrigation systems, as well. Supplements well with other forms of power like wind and solar. With different avenues of renewable energy, your house will be more environmentally sustainable.

It's easy to use and comes with an optional dry bag to protect it from rainy weather or very fast-moving water. It comes in a USB or 12V option and can be used with wind or even hand-cranked! Hydroelectric systems require flowing water to extract energy from the rotational energy produced by placing the propeller turbine in the water. If you're near a river or a faster-moving stream, this will function in direct correlation to the flow rate of the water. Keep the available water flow rate of your camp site in mind before pressing buy on this product.

Portable mini hydroelectric generator

Consider a solar charger instead if you're in a more arid location or have little water movement. Interested in other solar products that are great for camping? Check out our review of the 6 Best Solar Refrigerators TESTED!

The Windzilla is a great mid-tier option. It doesn't have the massive generating power that some others do on this list, but it provides great power. It's also a lot cheaper, and the versatility gives it some higher marks.

Its compact design makes it ideal for household use, and it can be used especially well in narrow waterways where other turbines might not be considered. It might be a little bit less reliable than some of the smaller units, but it can still handle smaller-scale jobs. It does require optimal water pressure and can be quite loud sometimes.

Measuring your flow rates throughout the year and reading up on laws that regulate hydroelectric power production or the usage of water from rivers is a must before installing a generator. You can view relevant information on your local government's website.
