charging system can also be the wiring between the alternator and the battery, but it's best to always start with the alternator. Because the alternator supplies current to the vehicle's electrical systems, this is where you'll notice most that something is amiss.

Before you get to work, you'll want to gather all the necessary components. Choose a level, safe work area. In addition to a replacement alternator, you'll need some tools:

Automotive designs vary greatly from car to car. You may need something else, and many cars won't need the last two items to get the job done, although some do. It all depends on how your make and model was made. If you don't have a tensioner tool, borrow one from us through the AutoZone Loan-A-Tool program.

This step is crucial if you want to avoid a short, and trust us, you do. Before you go about disconnecting the negative cable, consult a vehicle repair manual to determine if a battery maintainer should or should not be used to avoid drivability and/or module re-programming issues. Make sure that the ignition is in the "OFF" position too. Now, disconnect the negative (ground) battery end and cover it up to avoid making contact during the job. The negative battery terminal is identified with a Minus sign (-).
