

Smart grid kigali

African Energy Commission is an African continental body in charge of ensuring, coordinating and harmonizing the: protection, conservation, development, rational exploitation, marketing and mainstreaming of energy resources on the African continent

AFREC supports the collaboration between the EU and AU through the AUC Department of Infrastructure and Energy with the aim of working on building blocs for setting up a Harmonised African Electricity Market.

Kigali, RWANDA, October 2nd 2018: The 3rd Africa Smart Grid Forum was organized jointly by the Rwandan Government represented by the Rwanda Development Board, the Rwanda Standards Board and the African Electrotechnical Standardization Commission (AFSEC) in collaboration with the African Energy Commission "AFREC" from October 1st to October 04th 2018.

The Forum focalizes on International Experiences of Intelligent Electrical Networks for the sharing of experiences from experts from different countries on the theme of implementing a Smart Grid System as well as presenting ways of establishing implementation strategies for the development of smart grids in AFRICA.

The President of the African Electro technical Commission for Standardization (AFSEC) expressed his joy in witnessing the organization, for the 3rd time, of the an Africa Smart Grid Forum, including this Forum held in the Republic of Rwanda to find the key to Sustainable Energy in Africa. He pointed out that AFSEC was created in 2008 by the African Union. The role of AFSEC is to help Africa in setting up the existing international standards and to implement in the African Union projects in such a way to respond favorably to the African markets. Hence, it would be necessary to:

He explained that in the face of changing technologies, standardization is important and fundamental. It is a necessary condition to secure our markets. The African market can only function properly through quality derived from standardization. He expressed his disappointment regarding the fact that many countries in the African continent are not members of AFSEC, underscoring the need for all countries to join.

The Representative of the African Union Commission (AUC) affirmed that AFSEC is supported by the African Union due to the paramount role it represents to the eyes of the Intelligent Networks in Africa. He highlighted that the two events that are organized the same week and at the same place, at the Palais des Congrès, Kigali in the Republic of Rwanda:

are an opportunity to debate the subject of African energy development Efficiently and normally. The Representative of the African Union Commission said that Africa has no option but to consider smart grids to reach the challenges. To serve the African people, we must improve access to energy and security in the supply of energy that must be reliable. Africa is dropping back while Europe has come a long way to

prominence. So it would be necessary to achieve:

- a systematic growth in the use of smart grids,- a conformed standardization and use,- Africa will benefit more by adopting smart grid,- It is important that, with decisions to accelerate the establishment of smart grids, the energy sector becomes more cost-effective and attract private sectors.
