

## Solar energy for businesses andorra

Endesa's being awarded the Mudjar tender presents an opportunity to implement a great project for the future of the area -- a project built by all of us and designed to have a big impact. The project will be a model for how territories -- in this case, one where we have always been present -- can move to cleaner sources of energy in a fair way.

The plan is designed to address the needs of the rural population through business and cultural initiatives aimed at creating jobs and diversifying economic activity. It utilises the region's endogenous resources to create optimal outcomes. At Endesa we are building a business model integrated with society, creating profitable solutions, solving social needs and generating mutually beneficial relationships with communities, to achieve more equitable, inclusive and sustainable societies that leave no one behind.

Endesa is committed to working with local associations and stakeholders in order to improve the area's growth and empowerment. Through a participatory process, Endesa has held meetings with numerous groups in order to discuss how best to move forward.

Endesa's projects always include a focus on training the local population and developing the area socially and economically. Those are two of the most important goals of Endesa's new plan for Andorra and its surrounding region. The local population will be offered extensive training in new potential business sectors in the area. This will help to retrain them for future success. All of this is developed in cooperation with local businesses, social actors and the municipalities of the communities where our renewable energy projects are located.

Another pillar of this plan is to open up employment opportunities for the unemployed in the area. More than 3,500 jobs will be created during the construction phase of the renewable energy projects and 300 direct permanent jobs will be created with the operation of these facilities and the start-up of the projects included in this support plan.

All renewable energy projects in this plan are a cross between the energy and primary sectors, always with the aim of achieving the greatest possible integration with the territory. They are semi-natural installations, reservoirs of biodiversity, with shared use of the land with the local stakeholders in this sector, integrating agricultural activities between the solar panels, such as the cultivation of herbs and cereals, bio-cultivation, sheep pastures for natural clearing and beekeeping.

Endesa has extensive experience in planning and developing this type of project. There are currently 37 agrovoltaic projects underway or under construction at the national level in its renewable facilities, in addition to another 24 biovoltaic projects underway or in planning, aimed at improving biodiversity in the area.

## Solar energy for businesses andorra

A vivid example of the integration of these projects into the local community can be found in Carmona (Seville). Solar panels, bees, sheep and aromatic plants coexist between technology and the primary sector, transforming these installations into a sustainable and circular environment, making this municipality a benchmark for the energy transition.

We are excited to embark on the challenge of implementing this great plan for the future of the area. We are committed to providing the highest level of service and support to our customers and community. We take pride in being a responsible and reliable partner in the territory we call home.

Through its renewable subsidiary Enel Green Power España, Endesa today presented its future plan for Andorra following the award of the tender called by the Ministry of Ecological Transition and the Demographic Challenge and which has just been confirmed.

The plan presented by Endesa, which combines new renewable capacity with unique hybridisation of technologies, projects with green hydrogen and a synchronous compensator, also features a real social-economic development plan in the area that will create more than 6,300 jobs, 370 of which will be direct permanent jobs in the area for the operation of the installation.

“Endesa has historical links with Andorra, and with this plan our aim was to show that we wish to continue playing a leading role in its history,” said Endesa's General Manager for Generation, Rafael González. “It is a real project that will continue to generate value in the area and which involves a commitment by Endesa to invest more than EUR1,500 million for the development of these projects.”
