Sucre battery management systems

Sucre battery management systems

High range, durability, and safety are the key expectations for the next generation of batteries. As the electric age accelerates, Marquardt is at the forefront, delivering innovative battery management solutions that ensure the long-term efficiency and safety of battery packs.

Enhance your EV battery's performance with our High Voltage Battery Management System. Serving as the brain of your battery system, it expertly manages energy and data, ensuring optimal safety, efficiency, and reliability. Designed to extend battery life and reduce maintenance, our HV Box meets the highest industry standards, making it the ideal solution for a wide range of vehicles, from passenger cars to heavy-duty trucks. Trust in our advanced technology to deliver long-lasting, high-performing electric power.

Optimize your vehicle's performance and safety with our Low Voltage Battery Management System (LV BMS). Designed for modern vehicles, our LV BMS ensures efficient battery protection, extended lifespan, and real-time monitoring. Whether on-road or off-road, experience seamless integration, enhanced reliability, and reduced maintenance with a system that adapts to various battery chemistries. Trust our innovative technology to keep your vehicle running smoothly.

Enhance your energy systems with Marquardt's Cell Module Controller (CMC). Designed for high-voltage batteries, our CMC ensures superior safety, flexibility, and reliability by actively monitoring and controlling cells. Ideal for automotive, trucking, and stationary applications, it minimizes downtime and maintenance, ensuring optimal performance and protection. Explore the future of battery safety with our CMC.

Experience unparalleled control and safety in high-voltage applications with Marquardt's HV Sensor. Designed for precision and reliability, our shunt-based sensor offers fast response times, scalable design, and seamless integration across electric vehicles, home energy systems, and industrial applications. Elevate your systems with advanced measurement capabilities and ASIL-certified safety features.

All of the battery cells or modules in a battery pack are monitored and managed by a single controller in a centralized BMS system. The primary functions of a BMS are carried out by this controller, these functions include data collecting, processing, and command execution. It typically performs tasks including controlling charge/discharge rates, monitoring voltage, current, and temperature, safeguarding the battery cells from operating outside of their safe working range, and carrying out balancing algorithms.

A wiring harness connects the battery modules or cells to this central controller. A centralized BMS typically has a more straightforward design, less complicated assembly, and lower costs than other types of BMS architectures due to its solitary control system.

Various applications frequently adopt centralized BMS topologies. They are especially well-suited for smaller,

Sucre battery management systems

less complex battery systems with a low cell count because of their simplicity and cost-effectiveness. Electric bikes, scooters, and other light electric vehicles are prominent examples of applications for them.

A primary benefit of employing a centralized BMS is its simplicity. By consolidating all tasks under a single controller, the system becomes more straightforward to design, assemble, and maintain. This approach also tends to be cost-effective, primarily because it involves fewer components and reduced wiring complexity.

To sum up, while centralized BMS systems offer advantages in simplicity and cost-efficiency, it's essential to acknowledge their limitations, especially when contemplating their use in more intricate or expansive applications.

The modular BMS is a middle-ground strategy that combines the advantages of both centralized and distributed designs to offer a scalable and flexible battery management solution.

In a modular BMS configuration, the system is partitioned into multiple identical modules, each tasked with monitoring and overseeing a specific subset of the battery pack"s cells or modules. Each module takes on the core responsibilities of the BMS for the cells it is assigned to, which includes duties such as monitoring cell voltage, temperature, and State of Charge (SOC), executing control directives, and ensuring cell safety.
