Tesla powerwall northern cyprus

The Tesla Powerwall is a battery backup system for residential homeowners that you can buy directly from Tesla or from an installer. It houses a 13.5 kWh battery which should power a home for between one and two days according to Tesla -- not bad numbers. Tesla prefers that you integrate a Tesla Powerwall with a Tesla Solar Home system, whether it's the company's solar panels or the Solar Roof, but you can still use this battery without a solar system if you prefer. In that case, it'll charge off of the power in your home and then activate when you lose power.

The Powerwall has a bunch of great features. It looks good, it's easy to control, and you can buy one with and without a power inverter to better augment your setup. Today's Powerwalls are technically the second generation. The first-generation Powerwalls are discontinued which means that, despite Tesla's naming scheme, you only have access to the newest version of the Powerwall.

Another thing to keep in mind is that the installation wait times can take a while. Owners have told stories of waits that can take as long as six to 12 months. However, it seems many installs are completed within a few months. With all that in mind, let's take a look at some other pros and cons of the Tesla Powerwall.

Let's start with the most obvious pro -- the Tesla Powerwall works, and it works well. It's a reasonably sized unit that measures a little under four feet tall, two and a half feet wide, and about six inches deep. The small stature should make it easy to integrate almost anywhere in or around a house or even an apartment. The power capacity is about average for a house battery so you're not missing out if you go with this over a competitor. You can also connect up to ten Powerwalls together for 135kWh of energy storage, which is enough to power a home for a week or more.

There are other basic benefits as well. The Powerwall is an AC-coupled battery, so it can be easily integrated into existing solar panel systems. That makes it simple for consumers who already went through that process and just need a battery to store some energy. You can also pair it with Tesla's Solar Inverter, which is excellent in its own right.

The Powerwall also comes with its own app, although this isn't the most unique feature these days. You can use it to check how much energy you have stored, how much you've consumed, and other metrics.

Tesla has a solution for this if you own a Powerwall. The app lets you schedule it so that you use energy from your Powerwall during the peak hours of the day. The battery then recharges during the off-peak hours, which can save you a bunch of money. The Powerwall isn't the only home energy storage product capable of this, but its excellent app helps make it very easy for consumers to configure.

Those with solar panels can also avoid pulling off of the grid during the times of the day when electricity is

the most expensive. It's just an all-around win for the Powerwall. It may take a long time before this practice pays off your Powerwall in energy savings, but every little bit helps.

Tesla backs up their Powerwalls with one of the best warranties available for home backup batteries. Each Powerwall comes with a 10-year warranty that offers an unlimited number of charge cycles. The 10-year part of the warranty isn't terribly special. Most competitors do 10-year or 15-year warranties. The lack of charge cycle restrictions, on the other hand, is much more impressive.

This guarantee means you can discharge and recharge the battery a nearly endless number of times and still get a repair or replacement under warranty if your Powerwall breaks down within 10 years. This warranty is only available in the U.S. and you must purchase the Powerwall directly from Tesla or a Tesla-approved installer for it to apply.

To be fair to the competition, warranties in this space are generally good all around. Most competitors give you 10 years with 10,000 charge cycles. That's about 83 charge cycles per month or about two and a half charge cycles per day. Most people shouldn't hit those kinds of numbers even with heavy usage. Those who only use battery backups for power outages likely never will. Even so, Tesla's unlimited cycle warranty is an extra step that delivers complete peace of mind. You can use it as often as you want to without worrying about voiding the warranty.

Tesla gives consumers the option to bundle the Powerwall with their existing solar panel and Solar Roof products, which are some of the better-looking panels you can get. They are low profile, integrate well with existing roofs, and are all black to make it harder to see the grid pattern in the panel. Additionally, Tesla price matches competitors in the U.S., which makes its products among the cheapest solar panel systems. The panels boast approximately a 20% efficiency rate, which is well within the average for the solar panel industry.
