

Tunis city energy transition

TUNIS, November 29, 2023 - Water scarcity, coastal erosion and more frequent flooding are among Tunisia's most pressing climate challenges, says a new World Bank Group report, which suggests a series of urgent adaptation and decarbonization actions that would help boost Tunisia's economic recovery and create jobs.

The World Bank Group's Tunisia Country Climate and Development Report (CCDR), released ahead of COP28, identifies policy actions and investment opportunities that could reduce the impacts of climate change on people and businesses and enhance Tunisia's economic competitiveness.

The report says combined adaptation and mitigation measures to address climate change and decarbonize the electricity sector could boost GDP growth to 8.8 percent by 2030, reduce poverty and slash energy-related emissions. On the flip side, failure to act could result in GDP losses of up 3.4% by 2030, leading to projected annual losses of around 5.6 billion dinars (\$1.8 billion).

"The Tunisia CCDR, aligned with the National Strategy for Ecological Transition and the 2023-2025 Development Plan, underscores the enduring support of the World Bank--a steadfast partner in Tunisia's path towards a more sustainable future," said Jesko Hentschel, World Bank Director for the Maghreb. "Adapting to a changing climate and promoting a green economy represents a unique opportunity for Tunisia's growth, resilience, and sustainable development," he added.

Tunisia faces a major water scarcity issue, which compromises agricultural production as low and variable rainfall exposes the deficiencies of a sector that needs reforms to adapt to climate change. In addition, water losses at the National Water Distribution Company rose from 25% in 2010 to 34% in 2021.

The report also emphasizes that sea level rise could impact nearly a quarter of Tunisia's coastal zone by 2050, with potential total loss of land worth US\$1.6 billion. The likelihood of catastrophic flooding is projected to increase almost ten-fold and the costs for rehabilitating road assets alone from this flooding could reach \$277 million by 2050. These risks not only imperil the livelihoods of people who live on the coast and in flood-prone areas but also jeopardizes the country's international standing as a sought-after travel destination.

The report calls for strategic actions to address water scarcity, including rationalizing water demand, strengthening water networks to reduce water losses and waste, and protecting ecosystems, especially watersheds, oasis ecosystems, forests, and wetlands to increase water availability and resilience to climate shocks.

"This Tunisia CCDR demonstrates the importance of public and private sector collaboration when addressing serious challenges like climate change," said Cheick-Oumar Sylla, IFC's Regional Director for North Africa and the Horn of Africa. "Building on our partnership with Tunisia in the renewable energy sector, IFC is

committed to helping the country adapt to and mitigate the effects of a shifting climate, while achieving sustainable growth."

Given Tunisia's current macroeconomic challenges, the report highlights the importance of creating the right macro-financial conditions for investments to achieve these objectives. This requires redirecting recurrent public expenditures towards the most urgent public adaptation investments. It is also essential to facilitate private sector investments in green activities, for instance by eliminating sector-specific authorizations and constraints, streamlining investment approvals, and reducing the regulatory influence of incumbent sector operators.

Tunisia and its regions and cities of the interior are particularly vulnerable to climate change. Localising effective mitigation and adaptation measures holds the potential for a green and climate-resilient economic transition. Tunisia's interior cities can be at the forefront of these efforts.

Cities Alliance supports an energy audit of 20,000 light points in Beja, Jendouba, and Tataouine, providing decision-makers and technical staff with the information and recommendations they need to budget for and prioritise targeted actions to minimise energy consumption and improve the quality and safety of public lighting. Moreover, Cities Alliance also directly supports the installation of energy-efficient LED streetlights.
