

# What is a portable power station

What is a portable power station

Is a bank just a vault? Though the battery is the main part of a portable power station, there are also a number of components and technologies that send stored energy safely and efficiently to your appliances. They have tech that makes them recharge faster, screens that show input and output, and even apps for remote energy management.

Just the names - neither a portable power station nor a solar generator create energy on their own, they just store it so you can use it anytime. The same goes for battery-powered generators. The "solar" element just indicates that generators can connect to solar panels but so can some portable power stations.

Portable power stations have much more capacity and outlets than power banks, which usually only have USB outlets. Portable power stations can be used for things that would normally plug into a wall or car outlet. This is because they have enough juice to power appliances for hours and can output more electricity.

Portability, capacity, lifespan, and features are what make certain models right for some and not others. The type of battery used will have a big impact on the first three. NCM batteries are lighter while LFP (LiFePO4) batteries have a longer lifespan and greater efficiency.

Battery chemistries have moved away from the lead-acid ones found in cars, and as a result, are now much lighter and more efficient. We're still not at the point where your house can run off of a battery the size of your phone, but we're getting a lot closer. There are plenty of things you can use with today's portable power stations that you couldn't have done feasibly a few years ago.

How much electricity a portable power station can store is measured in watt-hours (Wh) or kilowatt hours (kWh), which is one watt of electricity being used for (you guessed it!) one hour. If you turn on a 50W bulb for 10 hours, it uses 500Wh of energy.

All of the devices above add up to 150 watts, and for 3 hours would use 450Wh. A 450Wh portable power station wouldn't cut it though. With about 10-20% of the battery storage being lost when powering up devices, it would take a 500Wh-560Wh portable power station to make this party happen. That's if you use it from 100% down to 0%, which is a no-no for battery health. If you plan to keep it in the 80%-20% sweet spot for maximum lifespan, you'd want a portable power station with around 800Wh-900Wh.

500 cycles - All rechargeable battery's subtly lose capacity over their lifetime, and part of this is due to their charge/discharge cycles. A full cycle is when the battery has been used a total of 100% - if you use 30% today, 50% tomorrow, and 20% the next day, that's one cycle. That's regardless of if/how much you recharged it on these days.

# What is a portable power station

80% capacity - After the 500 cycles, then what? Your battery isn't at the end of its life, it's only at 80% of its original health. A battery that could once power a light for 100 hours, would only be able to power it for 80 hours. When comparing lifespans between portable power stations, it's important the health percentage is the same: a battery that's 500 cycles to 80% capacity is better than a battery that's 500 cycles to 50% capacity.

At the very minimum, portable power stations should have USB and AC outlets. From there, the bells and whistles you may come across are a variety of outlets, various ways to charge, app functionality, and other available accessories (e.g., home integration kits and smart generators).

Gas generators do move a lot of power, we'll give them that, but... they can't be used inside, they're loud, and you can't recharge them for free. There's also the issue with being harder to start and being pretty unsophisticated.

People like portable power stations because it feels more natural to just press an "on" button and not have to winterize or check fuel levels. Gas generators were the go-to for a long time because that's all there was, but now there are portable power stations big enough for energy demanding equipment like air conditioners, table saws, and conventional ovens.
