## Wind turbine generator for rv

We've talked a lot about solar power on this blog over the years, and we're big fans. We've got what for us is the ultimate RV solar panel system, and it has served us very well overall. But there's no getting around the fact that the sun goes down every night, and that clouds, rain, trees, and other things that interfere with the sun happen regularly. We recently read about an innovative portable RV wind turbine, and it got us thinking – would a wind turbine be a good choice for RVers and campers?

An RV wind turbine is essentially a portable windmill that uses the power of the wind to generate electricity to power your RV's devices and appliances when you're off-grid.

An RV wind turbine is usually mounted on the roof of the RV, mounted to the RV ladder, or sometimes on a pole that stands independent of the rig (using either a hitch-mounted flag pole holder or one you can park the RV's tire on).

A wind turbine has large blades that turn by the power of the wind. As the blades spin, the aerodynamic force of the rotor blades turns the generator, creating electricity. The faster the rotor blades spin, the more electricity is generated.

In theory, a wind turbine can power an RV. But in real-world practice, it's not quite as smooth a process as one might think, simply because the amount of electricity generated by a wind turbine that's small enough to be easily portable isn't all that much – and is very much dependent on the weather. Depending on how much power you need to generate, and how cooperative the weather is, you could easily find yourself short on power.

The cool thing is that though the sun goes down at night, and thus doesn't generate solar power, wind can continue through the night. This means a wind turbine can continue to generate electricity.

But because wind turbines only generate power when the wind is blowing, it's important to connect an RV wind turbine to a battery bank to store that energy for later use. Some RV wind turbines plug directly into an RV house battery bank, however, it's more efficient to connect the turbine to a charge controller just as we do with solar panels. This not only increases efficiency but also protects the battery bank. Many RV wind turbine systems include a charge controller for this reason.

Some (but not all) wind turbines can be combined with a solar power system, and there are combination kits available on the market that do exactly that. These are generally referred to as hybrid systems.

The greatest disadvantage of RV wind turbines is that a wind turbine generates no power at all unless the wind is blowing. And we're not talking about a slight breeze here. Wind turbines typically require winds

## Wind turbine generator for rv

blowing at greater than 20 mph for maximum output.

However, it can be hard to enjoy camping in strong winds. Also, when using an RV wind turbine, you need to make sure there are no trees or other obstructions blocking the wind (though that's less of a problem than trees blocking the sun for solar).

It's also critical that the wind is blowing at just the right speed, and consistently so. And that's something outside your control. But large gusts of wind not only aren't helpful but can also shut the wind turbine system down (or, in the worst-case scenario, actually knock the system down).

So, generally speaking, RV wind turbines, while they're capable of generating power with winds at around 10 mph, they require continuous winds of approximately 26-30 mph to generate electricity at their maximum rated capacity.
