

Wind turbine pros and cons

Wind turbine pros and cons

Wind turbines harness energy from the wind using mechanical power to spin a generator and create electricity. Not only is wind an abundant and inexhaustible resource, but it also provides electricity without burning any fuel or polluting the air.

Wind energy is a job creator. Wind power is remote. On the pros side, wind is a clean, renewable energy source and is one of the most cost-effective sources of electricity. On the cons side, wind turbines can be noisy and unappealing aesthetically and can sometimes adversely impact the physical environment around them.

Studies show that wind energy's carbon footprint is quickly offset by the electricity it generates and is among the lowest of any energy source. Learn the facts about renewable power produced by wind, and hear Caltech engineer John Dabiri discuss the pros and cons and the future of wind energy.

As with all forms of energy creation, there are specific advantages and disadvantages of wind turbines to consider. Some sources of power work better than others in different geographic locations, which is why it is essential to consider these crucial points before finalizing an installation effort.

The main pros of wind energy include sustainability, a low carbon footprint, air quality protection, the generation of few waste products, and energy independence. However, the main cons of wind energy include intermittency, high costs, noise and visual pollution, and impacts on wildlife.

Wind turbines provide us with a way to generate electricity and power when the breezes blow. The air movement occurs because of the differences in temperature that happen on our planet. When the mountains, valleys, and atmosphere all receive different levels of energy from the sun, the imbalances form wind that attempts to achieve homeostasis. Then the turbines have blades that capture this movement to generate the energy we need.

We have used the power from the wind to propel vessels for almost 7,500 years. The Chinese were using turbines to draw water from the ground around the year 200 B.C., while windmills became a useful tool for the grinding of grain in the Middle East. By the time we reached the Middle Ages, this technology was extensively used for food production. It wouldn't be until the late 19th century before we realized this technology was useful in the creation of power and electricity.

1. Wind turbines provide us with one of the cleanest forms of energy available today. Wind turbines don't rely on any fossil fuels to power the spinning of their blades. That means the power we create from this resource doesn't contribute to the issue of climate change during its energy production cycle. The only emissions expense that we must consider with this renewable resource involves the release of carbon and other gases during the manufacturing, transportation, and installation of each unit.

Wind turbine pros and cons

Because wind turbines can produce an almost infinite source of energy we can use after installation, the low emissions profile creates net gains very quickly to reduce our impact on the environment.

2. Turbines don't require fuel to operate. Large-scale wind farms don't rely on combustion to create an energy resource for us to use. That means there is no need for fuel beyond the cost of inspecting each unit to ensure it functions correctly. That means the overall cost of operations is much less when compared to other sources of renewable energy since some of them require ongoing fossil fuel support to operate.

3. Wind turbines won't disrupt agricultural activities. The modern wind turbine requires a minimal footprint during its installation. That means an energy supplier can build units almost anywhere that consistent breezes blow, including on existing farmland. Farmers receive money in return for the structures being built on their property through leases or contracts. These funds help to supplement their agricultural revenues while disruptions remain minimal at ground level.

The current rate of wind turbine adoption with the available land space is only 1.5% today, but this advantage could help us to quickly expand the amount of energy we're producing with this resource.
